Home cinema SONY hcd-dz20. The power supply when whipping 220v starts to whistle (transformer). On the power foot of the STR-F6168, the voltage drops from 21v to 10v. Soldered mikruhu-21v. I connected only the power foot and the ground, also 10v. Capacity changed. Number according to the ic901 scheme.

The voltage on the emitter and base q901 is normal according to the scheme (20v). On ic921, the supply voltage is 21v as according to the scheme. What to replace or what to remake?

upd: I found the full analog of strf6264, but not in the city, on the chip dip too.

A piece of circuit with a microcircuit added. Also added the entire service.

Thanks in advance.
