C4PICmicros
===========

This CD contains a complete course on learning C for imbedded
microcontrollers, specifically the PICmicro microcontroller
from Microchip. As well as the course itself, there are all
the tools you will need to develop your own software: a
C-compiler (C2C), an assembler (MPLAB) and a send program (PPP).

Installation

To install this course, run the "Install_C4PICs.EXE" file.
You have 2 choices of installation - FULL and MINIMAL. The
FULL installation will put the whole of the course onto your
hard drive. The MINIMAL install will install only the tools
onto your hard drive (and so you will need the CD in the
drive to use this course).

Uninstallation

To uninstall this course, open the Control Panel of your
computer (in the Start Menu under "Settings").
Double-click the "Add/Remove Programs" icon and select the
"Matrix C4PICmicros" item.
