## Digital video encoder

## SAA7102; SAA7103

### 1 FEATURES

- Digital PAL/NTSC encoder with integrated high quality scaler and anti-flicker filter for TV output from a PC
- 27 MHz crystal-stable subcarrier generation
- Maximum graphics pixel clock 45 MHz at double edged clocking, synthesized on-chip or from external source
- Up to  $800 \times 600$  graphics data at 60 Hz or 50 Hz with programmable underscan range
- Three Digital-to-Analog Converters (DACs) at 27 MHz sample rate for CVBS (BLUE,  $C_B$ ), VBS (GREEN, CVBS) and C (RED,  $C_R$ ) (signals in parenthesis are optional); all at 10-bit resolution
- Non-interlaced  $C_B$ -Y- $C_R$  or RGB input at maximum 4 : 4 : 4 sampling
- Downscaling from 1 : 1 to 1 : 2 and up to 20% upscaling
- Optional interlaced  $C_B$ -Y- $C_R$  input Digital Versatile Disk (DVD)
- Optional non-interlaced RGB output to drive second VGA monitor (bypass mode, maximum 45 MHz)
- $3 \times 256$  bytes RGB Look-Up Table (LUT)
- Support for hardware cursor
- Programmable border colour of underscan area
- On-chip 27 MHz crystal oscillator (3rd-harmonic or fundamental 27 MHz crystal)
- Fast I<sup>2</sup>C-bus control port (400 kHz)
- Encoder can be master or slave
- Programmable horizontal and vertical input synchronization phase
- Programmable horizontal sync output phase
- Internal Colour Bar Generator (CBG)
- Optional support of various Vertical Blanking Interval (VBI) data insertion
- Macrovision™(1) Pay-per-View copy protection system rev. 7.01 and rev. 6.1 as option; this applies to the SAA7102 only. The device is protected by USA patent numbers 4631603, 4577216 and 4819098 and other intellectual property rights. Use of the Macrovision anti-copy process in the device is licensed for non-commercial home use only. Reverse engineering or disassembly is prohibited. Please contact your nearest Philips Semiconductors sales office for more information.

- Power-save modes
- Joint Test Action Group (JTAG) boundary scan test
- Monolithic CMOS 3.3 V device, 5 V tolerant I/Os
- QFP44 and BGA156 packages
- Same footprint as SAA7108E; SAA7109E.

### 2 GENERAL DESCRIPTION

The SAA7102; SAA7103 is used to encode PC graphics data at maximum  $800 \times 600$  resolution to PAL (50 Hz) or NTSC (60 Hz) video signals. A programmable scaler and interlacer ensures properly sized and flicker-free TV display as CVBS or S-video output.

Alternatively, the three Digital-to-Analog Converters (DACs) can output RGB signals together with a TTL composite sync to feed SCART connectors.

When the scaler/interlacer is bypassed, a second VGA monitor can be connected to the RGB outputs and separate H and V-syncs as well, thereby serving as an auxiliary monitor at maximum  $800 \times 600$  resolution/60 Hz (PIXCLK < 45 MHz).

The device includes a sync/clock generator and on-chip DACs.

(1) Macrovision™ is a trademark of the Macrovision Corporation.

**Notes**

1. Pin type: I = input, O = output, S = supply.
2. In accordance with the "IEEE1149.1" standard the pins TDI, TMS, TCK and  $\overline{\text{TRST}}$  are input pins with an internal pull-up resistor and TDO is a 3-state output pin.
3. Pins FSVGC, VSVFC,  $\overline{\text{CBO}}$ , HSVG C and TTXRQ\_XCLKO2 are used for bootstrapping; see Section 7.1
4. For board design without boundary scan implementation connect  $\overline{\text{TRST}}$  to ground.
5. This pin provides easy initialization of the Boundary Scan Test (BST) circuit.  $\overline{\text{TRST}}$  can be used to force the Test Access Port (TAP) controller to the TEST\_LOGIC\_RESET state (normal operation) at once.

## Digital video encoder

## SAA7102; SAA7103

### 7 FUNCTIONAL DESCRIPTION

The digital video encoder encodes digital luminance and colour difference signals ( $C_B$ - $Y$ - $C_R$ ) or digital RGB signals into analog CVBS, S-video and, optionally, RGB or  $C_R$ - $Y$ - $C_B$  signals. NTSC M, PAL B/G and sub-standards are supported.

The SAA7102; SAA7103 can be directly connected to a PC video graphics controller with a maximum resolution of  $800 \times 600$  at a 50 or 60 Hz frame rate. A programmable scaler scales the computer graphics picture so that it will fit into a standard TV screen with an adjustable underscan area. Non-interlaced-to-interlaced conversion is optimized with an adjustable anti-flicker filter for a flicker-free display at a very high sharpness.

Besides the most common 16-bit  $4 : 2 : 2$   $C_B$ - $Y$ - $C_R$  input format (using 8 pins with double edge clocking), other  $C_B$ - $Y$ - $C_R$  and RGB formats are also supported; see Tables 25 to 30.

A complete  $3 \times 256$  bytes Look-Up Table (LUT), which can be used, for example, as a separate gamma corrector, is located in the RGB domain; it can be loaded either through the video input port PD (Pixel Data) or via the I<sup>2</sup>C-bus.

The SAA7102; SAA7103 supports a  $32 \times 32 \times 2$ -bit hardware cursor, the pattern of which can also be loaded through the video input port or via the I<sup>2</sup>C-bus.

It is also possible to encode interlaced  $4 : 2 : 2$  video signals such as PC-DVD; for that the anti-flicker filter, and in most cases the scaler, will simply be bypassed.

Besides the applications for video output, the SAA7102; SAA7103 can also be used for generating a kind of auxiliary VGA output, when the RGB non-interlaced input signal is fed to the DACs. This may be of interest for example, when the graphics controller provides a second graphics window at its video output port.

The basic encoder function consists of subcarrier generation, colour modulation and insertion of synchronization signals at a crystal-stable clock rate of 13.5 MHz (independent of the actual pixel clock used at the input side), corresponding to an internal  $4 : 2 : 2$  bandwidth in the luminance/colour difference domain. Luminance and chrominance signals are filtered in accordance with the standard requirements of "RS-170-A" and "ITU-R BT.470-3".

For ease of analog post filtering the signals are twice oversampled to 27 MHz before digital-to-analog conversion.

The total filter transfer characteristics (scaler and anti-flicker filter are not taken into account) are illustrated in Figs 4 to 9. All three DACs are realized with full 10-bit resolution. The  $C_R$ - $Y$ - $C_B$  to RGB dematrix can be bypassed (optionally) in order to provide the upsampled  $C_R$ - $Y$ - $C_B$  input signals.

The 8-bit multiplexed  $C_B$ - $Y$ - $C_R$  formats are "ITU-R BT.656" (D1 format) compatible, but the SAV and EAV codes can be decoded optionally, when the device is operated in slave mode. For assignment of the input data to the rising or falling clock edge see Tables 25 to 30.

In order to display interlaced RGB signals through a euro-connector TV set, a separate digital composite sync signal (pin HSM\_CS SYNC) can be generated; it can be advanced up to 31 periods of the 27 MHz crystal clock in order to be adapted to the RGB processing of a TV set.

The SAA7102; SAA7103 synthesizes all necessary internal signals, colour subcarrier frequency and synchronization signals from that clock.

Wide screen signalling data can be loaded via the I<sup>2</sup>C-bus and is inserted into line 23 for standards using a 50 Hz field rate.

VPS data for program dependent automatic start and stop of such featured VCRs is loadable via the I<sup>2</sup>C-bus.

The IC also contains Closed Caption and extended data services encoding (line 21), and supports teletext insertion for the appropriate bit stream format at a 27 MHz clock rate (see Fig.14). It is also possible to load data for the copy generation management system into line 20 of every field (525/60 line counting).

A number of possibilities are provided for setting different video parameters such as:

- Black and blanking level control
- Colour subcarrier frequency
- Variable burst amplitude etc.

# Digital video encoder

# SAA7102; SAA7103

## 7.1 Reset conditions

To activate the reset a pulse at least of 2 crystal clocks duration is required.

During reset ( $\overline{\text{RESET}} = \text{LOW}$ ) plus an extra 32 crystal clock periods, FSVGC, VSVGC,  $\overline{\text{CBO}}$ , HSVGC and TTX\_SRES are set to input mode and HSM\_CSYNCR and VSM are set to 3-state. A reset also forces the I<sup>2</sup>C-bus interface to abort any running bus transfer and sets it into receive condition.

After reset, the state of the I/Os and other functions is defined by the strapping pins until an I<sup>2</sup>C-bus access redefines the corresponding registers; see Table 2.

**Table 2** Strapping pins

PIN	TIED	PRESET
FSVGC	LOW	NTSC M encoding, PIXCLK fits to 640 × 480 graphics input
	HIGH	PAL B/G encoding, PIXCLK fits to 640 × 480 graphics input
VSVGC	LOW	4 : 2 : 2 Y-C <sub>B-CR</sub> graphics input (format 0)
	HIGH	4 : 4 : 4 RGB graphics input (format 3)
$\overline{\text{CBO}}$	LOW	input demultiplex phase: LSB = LOW
	HIGH	input demultiplex phase: LSB = HIGH
HSVGC	LOW	input demultiplex phase: MSB = LOW
	HIGH	input demultiplex phase: MSB = HIGH
TTXRQ_XCLKO2	LOW	slave (FSVGC, VSVGC and HSVGC are inputs, internal colour bar is active)
	HIGH	master (FSVGC, VSVGC and HSVGC are outputs)

## 7.2 Input formatter

The input formatter converts all accepted PD input data formats, either RGB or Y-C<sub>B-CR</sub>, to a common internal RGB or Y-C<sub>B-CR</sub> data stream.

When double-edge clocking is used, the data is internally split into portions PPD1 and PPD2. The clock edge assignment must be set according to the I<sup>2</sup>C-bus control bits EDGE1 and EDGE2 for correct operation.

If Y-C<sub>B-CR</sub> is being applied as a 27 Mbyte/s data stream, the output of the input formatter can be used directly to feed the video encoder block.

## 7.3 RGB LUT

The three 256 byte RAMs of this block can be addressed by three 8-bit wide signals, thus it can be used to build any transformation, e.g. a gamma correction for RGB signals. In the event that the indexed colour data is applied, the RAMs are addressed in parallel.

The LUTs can either be loaded by an I<sup>2</sup>C-bus write access or can be part of the pixel data input through the PD port. In the latter case, 256 × 3 bytes for the R, G and B LUT are expected at the beginning of the input video line, two lines before the line that has been defined as first active line, until the middle of the line immediately preceding the first active line. The first 3 bytes represent the first RGB LUT data, and so on.

## 7.4 Cursor insertion

A 32 × 32 dots cursor can be overlaid as an option; the bit map of the cursor can be uploaded by an I<sup>2</sup>C-bus write access to specific registers or in the pixel data input through the PD port. In the latter case, the 256 bytes defining the cursor bit map (2 bits per pixel) are expected immediately following the last RGB LUT data in the line preceding the first active line.

The cursor bit map is set up as follows: each pixel occupies 2 bits. The meaning of these bits depends on the CMODE I<sup>2</sup>C-bus register as described in Table 5. Transparent means that the input pixels are passed through, the 'cursor colours' can be programmed in separate registers.

The bit map is stored with 4 pixels per byte, aligned to the least significant bit. So the first pixel is in bits 0 and 1, the next pixel in bits 3 and 4 and so on. The first index is the column, followed by the row; index 0,0 is the upper left corner.

**Table 3** Layout of a byte in the cursor bit map

D7	D6	D5	D4	D3	D2	D1	D0
pixel n + 3		pixel n + 2		pixel n + 1		pixel n	
D1	D0	D1	D0	D1	D0	D1	D0

For each direction, there are 2 registers controlling the position of the cursor, one controls the position of the 'hot spot', the other register controls the insertion position. The hot spot is the 'tip' of the pointer arrow.

## Digital video encoder

## SAA7102; SAA7103

It can have any position in the bit map. The actual position register describe the co-ordinates of the hot spot. Again 0,0 is the upper left corner. While it is not possible to move the hot spot beyond the left respectively upper screen border this is perfectly legal for the right respectively lower border. It should be noted that the cursor position is described relative to the input resolution.

**Table 4** Cursor bit map

BYTE	D7	D6	D5	D4	D3	D2	D1	D0
0	row 0 column 3	row 0 column 2	row 0 column 1	row 0 column 0				
1	row 0 column 7	row 0 column 6	row 0 column 5	row 0 column 4				
2	row 0 column 11	row 0 column 10	row 0 column 9	row 0 column 8				
...	...	...	...	...				
6	row 0 column 27	row 0 column 26	row 0 column 25	row 0 column 24

...	...	...	...	...				
254	row 31 column 27	row 31 column 26	row 31 column 25	row 31 column 24				
255	row 31 column 31	row 31 column 30	row 31 column 29	row 31 column 28				

**Table 5** Cursor modes

CURSOR PATTERN	CURSOR MODE	
	CMODE = 0	CMODE = 1
00	second cursor colour	second cursor colour
01	first cursor colour	first cursor colour
10	transparent	transparent
11	inverted input	auxiliary cursor colour

**7.5 RGB Y-C<sub>B</sub>-C<sub>R</sub> matrix**

RGB input signals to be encoded to PAL or NTSC are converted to the Y-C<sub>B</sub>-C<sub>R</sub> colour space in this block. The colour difference signals are fed through low-pass filters and formatted to a ITU-R BT.601 like 4 : 2 : 2 data stream for further processing.

The matrix and formatting blocks can be bypassed for Y-C<sub>B</sub>-C<sub>R</sub> graphics input.

When the auxiliary VGA mode is selected, the output of the cursor insertion block is immediately directed to the triple DAC.

**7.6 Horizontal scaler**

The high quality horizontal scaler operates on the 4 : 2 : 2 data stream. Its control engines compensate the colour phase offset automatically.

The scaler starts processing after a programmable horizontal offset and continues with a number of input pixels. Each input pixel is a programmable fraction of the current output pixel (XINC/4096). A special case is XINC = 0, this sets the scaling factor to 1.

If the SAA7102; SAA7103 input data is in accordance with "ITU-R BT.656", the scaler enters another mode. In this event, XINC needs to be set to 2048 for a scaling factor of 1. With higher values, upscaling will occur.

The phase resolution of the circuit is 12 bits, giving a maximum offset of 0.2 after 800 input pixels. Small FIFOs rearrange a 4 : 2 : 2 data stream at the scaler output.

**7.7 Vertical scaler and anti-flicker filter**

The functions scaling, Anti-Flicker Filter (AFF) and re-interlacing are implemented in the vertical scaler.

Besides the entire input frame, it receives the first and last lines of the border to allow anti-flicker filtering.

The circuit generates the interlaced output fields by scaling down the input frames with different offsets for odd and even fields. Increasing the YSKIP setting reduces the anti-flicker function. A YSKIP value of 4095 switches it off; see Table 95.

The programming is similar to the horizontal scaler. For the re-interlacing, the resolutions of the offset registers are not sufficient, so the weighting factors for the first lines can also be adjusted. YINC = 0 sets the scaling factor to 1; YIWGTO and YIWGTE must not be 0.

Due to the re-interlacing, the circuit can perform upscaling. The maximum factor depends on the setting of the anti-flicker function and can be derived from the formulae given in Section 7.17.

## Digital video encoder

## SAA7102; SAA7103

### 7.8 FIFO

The FIFO acts as a buffer to translate from the PIXCLK clock domain to the XTAL clock domain. The write clock is PIXCLK and the read clock is XTAL. An underflow or overflow condition can be detected via the I<sup>2</sup>C-bus read access.

In order to avoid underflows and overflows, it is essential that the frequency of the synthesized PIXCLK matches to the input graphics resolution and the desired scaling factor. It is suggested to refer to Tables 6 to 23 for some representative combinations.

### 7.9 Border generator

When the graphics picture is to be displayed as interlaced PAL, NTSC, S-video or RGB on a TV screen, it is desired in many cases not to lose picture information due to the inherent overscanning of a TV set. The desired amount of underscan area, which is achieved through appropriate scaling in the vertical and horizontal direction, can be filled in the border generator with an arbitrary true colour tint.

### 7.10 Oscillator and Discrete Time Oscillator (DTO)

The master clock generation is realized as a 27 MHz crystal oscillator, which can operate with either a fundamental wave crystal or a 3rd-harmonic crystal.

The crystal clock supplies the DTO of the pixel clock synthesizer, the video encoder and the I<sup>2</sup>C-bus control block. It also usually supplies the triple DAC, with the exception of the auxiliary VGA mode, where the triple DAC is clocked by the pixel clock (PIXCLK).

The DTO can be programmed to synthesize all relevant pixel clock frequencies between circa 18 and 44 MHz.

### 7.11 Low-pass Clock Generation Circuit (CGC)

This block reduces the phase jitter of the synthesized pixel clock. It works as a tracking filter for all relevant synthesized pixel clock frequencies.

### 7.12 Encoder

#### 7.12.1 VIDEO PATH

The encoder generates luminance and colour subcarrier output signals from the Y, C<sub>B</sub> and C<sub>R</sub> baseband signals, which are suitable for use as CVBS or separate Y and C signals.

Input to the encoder, at 27 MHz clock (e.g. DVD), is either originated from computer graphics at pixel clock, fed through the FIFO and border generator, or a ITU-R BT.656 style signal.

Luminance is modified in gain and in offset (the offset is programmable in a certain range to enable different black level set-ups). A blanking level can be set after insertion of a fixed synchronization pulse tip level, in accordance with standard composite synchronization schemes. Other manipulations used for the Macrovision anti-taping process, such as additional insertion of AGC super-white pulses (programmable in height), are supported by the SAA7102 only.

To enable easy analog post filtering, luminance is interpolated from a 13.5 MHz data rate to a 27 MHz data rate, thereby providing luminance in a 10-bit resolution. The transfer characteristics of the luminance interpolation filter are illustrated in Figs 6 and 7. Appropriate transients at start/end of active video and for synchronization pulses are ensured.

Chrominance is modified in gain (programmable separately for C<sub>B</sub> and C<sub>R</sub>), and a standard dependent burst is inserted, before baseband colour signals are interpolated from a 6.75 MHz data rate to a 27 MHz data rate. One of the interpolation stages can be bypassed, thus providing a higher colour bandwidth, which can be used for the Y and C output. The transfer characteristics of the chrominance interpolation filter are illustrated in Figs 4 and 5.

The amplitude (beginning and ending) of the inserted burst, is programmable in a certain range that is suitable for standard signals and for special effects. After the succeeding quadrature modulator, colour is provided on the subcarrier in 10-bit resolution.

The numeric ratio between the Y and C outputs is in accordance with the standards.

#### 7.12.2 TELETEXT INSERTION AND ENCODING (NOT SIMULTANEOUSLY WITH REAL-TIME CONTROL)

Pin TTX\_SRES receives a WST or NABTS teletext bitstream sampled at the crystal clock. At each rising edge of the output signal (TTXRQ) a single teletext bit has to be provided after a programmable delay at input pin TTX\_SRES.

## Digital video encoder

## SAA7102; SAA7103

Phase variant interpolation is achieved on this bitstream in the internal teletext encoder, providing sufficient small phase jitter on the output text lines.

TTXRQ\_XCLKO2 provides a fully programmable request signal to the teletext source, indicating the insertion period of bitstream at lines which can be selected independently for both fields. The internal insertion window for text is set to 360 (PAL WST), 296 (NTSC WST) or 288 (NABTS) teletext bits including clock run-in bits. The protocol and timing are illustrated in Fig.14.

Alternatively, this pin can be provided with a buffered crystal clock (XCLK) of 13.5 MHz.

### 7.12.3 VIDEO PROGRAMMING SYSTEM (VPS) ENCODING

Five bytes of VPS information can be loaded via the I<sup>2</sup>C-bus and will be encoded in the appropriate format into line 16.

### 7.12.4 CLOSED CAPTION ENCODER

Using this circuit, data in accordance with the specification of Closed Caption or extended data service, delivered by the control interface, can be encoded (line 21). Two dedicated pairs of bytes (two bytes per field), each pair preceded by run-in clocks and framing code, are possible.

The actual line number in which data is to be encoded, can be modified in a certain range.

The data clock frequency is in accordance with the definition for NTSC M standard 32 times horizontal line frequency.

Data LOW at the output of the DACs corresponds to 0 IRE, data HIGH at the output of the DACs corresponds to approximately 50 IRE.

It is also possible to encode Closed Caption data for 50 Hz field frequencies at 32 times the horizontal line frequency.

### 7.12.5 ANTI-TAPING (SAA7102 ONLY)

For more information contact your nearest Philips Semiconductors sales office.

### 7.13 RGB processor

This block contains a dematrix in order to produce RED, GREEN and BLUE signals to be fed to a SCART plug.

Before Y, C<sub>B</sub> and C<sub>R</sub> signals are de-matrixed, individual gain adjustment for Y and colour difference signals and 2 times oversampling for luminance and 4 times oversampling for colour difference signals is performed.

The transfer curves of luminance and colour difference components of RGB are illustrated in Figs 8 and 9.

### 7.14 Triple DAC

Both Y and C signals are converted from digital-to-analog in a 10-bit resolution at the output of the video encoder. Y and C signals are also combined into a 10-bit CVBS signal.

The CVBS output signal occurs with the same processing delay as the Y, C and optional RGB or C<sub>R</sub>-Y-C<sub>B</sub> outputs. Absolute amplitude at the input of the DAC for CVBS is reduced by  $\frac{15}{16}$  with respect to Y and C DACs to make maximum use of the conversion ranges.

RED, GREEN and BLUE signals are also converted from digital-to-analog, each providing a 10-bit resolution.

The reference currents of all three DACs can be adjusted individually in order to adapt for different output signals. In addition, all reference currents can be adjusted commonly to compensate for small tolerances of the on-chip band gap reference voltage.

Alternatively, all currents can be switched off to reduce power dissipation.

All three outputs can be used to sense for an external load (usually 75 Ω) during a pre-defined output. A flag in the I<sup>2</sup>C-bus status byte reflects whether a load is applied or not.

If the SAA7102; SAA7103 is required to drive a second (auxiliary) VGA monitor, the DACs receive the signal directly from the cursor insertion block. In this event, the DACs are clocked at the incoming PIXCLKI instead of the 27 MHz crystal clock used in the video encoder.

### 7.15 Timing generator

The synchronization of the SAA7102; SAA7103 is able to operate in two modes; slave mode and master mode.

In slave mode, the circuit accepts sync pulses on the bidirectional FSVGC (frame sync), VSVGC (vertical sync) and HSVGC (horizontal sync) pins: the polarities of the signals can be programmed. The frame sync signal is only necessary when the input signal is interlaced, in other cases it may be omitted. If the frame sync signal is present, it is possible to derive the vertical and the horizontal phase from it by setting the HFS and VFS bits. HSVGC and VSVGC are not necessary in this case, so it is possible to switch the pins to output mode.

Alternatively, the device can be triggered by auxiliary codes in a ITU-R BT.656 data stream via PD7 to PD0.

## Digital video encoder

## SAA7102; SAA7103

Only vertical frequencies of 50 and 60 Hz are allowed with the SAA7102; SAA7103. In slave mode, it is not possible to lock the encoders colour carrier to the line frequency with the PHRES bits.

In the (more common) master mode, the time base of the circuit is continuously free-running. The IC can output a frame sync at pin FSVG, a vertical sync at pin VSVG, a horizontal sync at pin HSVG and a composite blanking signal at pin  $\overline{CBO}$ . All of these signals are defined in the PIXCLK domain. The duration of HSVG and VSVG are fixed, they are 64 clocks for HSVG and 1 line for VSVG. The leading slopes are in phase and the polarities can be programmed.

The input line length can be programmed. The field length is always derived from the field length of the encoder and the pixel clock frequency that is being used.

$\overline{CBO}$  acts as a data request signal. The circuit accepts input data at a programmable number of clocks after  $\overline{CBO}$  goes active. This signal is programmable and it is possible to adjust the following (see Figs 12 and 13):

- The horizontal offset
- The length of the active part of the line
- The distance from active start to first expected data
- The vertical offset separately for odd and even fields
- The number of lines per input field.

In most cases, the vertical offsets for odd and even fields are equal. If they are not, then the even field will start later. The SAA7102; SAA7103 will also request the first input lines in the even field, the total number of requested lines will increase by the difference of the offsets.

As stated above, the circuit can be programmed to accept the look-up and cursor data in the first 2 lines of each field. The timing generator provides normal data request pulses for these lines; the duration is the same as for regular lines. The additional request pulses will be suppressed with LUTL set to logic 0; see Table 105. The other vertical timings do not change in this case, so the first active line can be number 2, counted from 0.

### 7.16 I<sup>2</sup>C-bus interface

The I<sup>2</sup>C-bus interface is a standard slave transceiver, supporting 7-bit slave addresses and 400 kbits/s guaranteed transfer rate. It uses 8-bit subaddressing with an auto-increment function. All registers are write and read, except two read only status bytes.

The register bit map consists of an RGB Look-Up Table (LUT), a cursor bit map and control registers. The LUT contains three banks of 256 bytes, where each RGB triplet is assigned to one address. Thus a write access needs the LUT address and three data bytes following subaddress FFH. For further write access auto-incrementing of the LUT address is performed. The cursor bit map access is similar to the LUT access but contains only a single byte per address.

The I<sup>2</sup>C-bus slave address is defined as 88H.

### 7.17 Programming the SAA7102; SAA7103

In order to program the SAA7102; SAA7103 it is first necessary to determine the input and output field timings. The timings are controlled by decoding binary counters that index the position in the current line and field respectively. In both cases, 0 means the start of the sync pulse.

At 60 Hz, the first visible pixel has the index 256, 710 pixels can be encoded; at 50 Hz, the index is 284, 702 pixels can be visible. Some variables are defined below:

- InPix: the number of active pixels per input line
- InPpl: the length of the entire input line in pixel clocks
- InLin: the number of active lines per input field/frame
- TPclk: the pixel clock period
- OutPix: the number of active pixels per output line
- OutLin: the number of active lines per output field
- TXclk: the encoder clock period (37.037 ns).

The output lines should be centred on the screen. It should be noted that the encoder has 2 clocks per pixel; see Table 72.

$$\begin{aligned} \text{ADWHS} &= 256 + 710 - \text{OutPix} \text{ (60 Hz);} \\ \text{ADWHS} &= 284 + 702 - \text{OutPix} \text{ (50 Hz);} \\ \text{ADWHE} &= \text{ADWHS} + \text{OutPix} \times 2 \text{ (all frequencies)} \end{aligned}$$

For vertical, the procedure is the same. At 60 Hz, the first line with video information is number 19, 240 lines can be active. For 50 Hz, the numbers are 23 and 287; see Table 78.

$$\text{FAL} = 19 + \frac{240 - \text{OutLin}}{2} \text{ (60 Hz);}$$

$$\text{FAL} = 23 + \frac{287 - \text{OutLin}}{2} \text{ (50 Hz);}$$

$$\text{LAL} = \text{FAL} + \text{OutLin} \text{ (all frequencies)}$$

## Digital video encoder

## SAA7102; SAA7103

Most TV sets use overscan, and not all pixels respectively lines are visible. There is no standard for the factor, it is highly recommended to make the number of output pixels and lines adjustable. A reasonable underscan factor is 10%, giving approximately 640 output pixels per line.

The total number of pixel clocks per line and the input horizontal offset need to be chosen next. The only constraint is that the horizontal blanking has at least 10 clock pulses.

The required pixel clock frequency can be determined in the following way: Due to the limited internal FIFO size, the input path has to provide all pixels in the same time frame as the encoders vertical active time. The scaler also has to process the first and last border lines for the anti-flicker function. Thus:

$$TPclk = \frac{262.5 \times 1716 \times TXclk}{InPpl \times \text{integer}\left(\frac{InLin + 2}{OutLin} \times 262.5\right)} \quad (60 \text{ Hz})$$

$$TPclk = \frac{312.5 \times 1728 \times TXclk}{InPpl \times \text{integer}\left(\frac{InLin + 2}{OutLin} \times 312.5\right)} \quad (50 \text{ Hz})$$

and for the pixel clock generator  $PCL = \frac{TXclk}{TPclk} \times 2^{21}$

(all frequencies); see Table 81.

The input vertical offset can be taken from the assumption that the scaler should just have finished writing the first line when the encoder starts reading it:

$$YOFS = \frac{FAL \times 1716 \times TXclk}{InPpl \times TPclk} - 2 \quad (60 \text{ Hz})$$

$$YOFS = \frac{FAL \times 1728 \times TXclk}{InPpl \times TPclk} - 2 \quad (50 \text{ Hz})$$

In most cases the vertical offsets will be the same for odd and even fields. The results should be rounded down.

Once the timings are known the scaler can be programmed.

XOFS can be chosen arbitrarily, the condition being that  $XOFS + XPIX \leq HLEN$  is fulfilled. Values given by the VESA display timings are preferred.

$$HLEN = InPpl - 1 \quad XPIX = \frac{InPix}{2} \quad XINC = \frac{OutPix}{InPix} \times 4096$$

XINC needs to be rounded up, it needs to be set to 0 for a scaling factor of 1.

$YPIX = InLin$

YSKIP defines the anti-flicker function. 0 means maximum flicker reduction but minimum vertical bandwidth, 4095 gives no flicker reduction and maximum bandwidth.

$$YINC = \frac{OutLin}{InLin + 2} \times \left(1 + \frac{YSKIP}{4095}\right) \times 4096$$

$$YIWGTO = \frac{YINC}{2} + 2048$$

$$YIWGTE = \frac{YINC - YSKIP}{2}$$

When  $YINC = 0$  it sets the scaler to scaling factor 1. The initial weighting factors must not be set to 0 in this case. YIWGTE may go negative. In this event, YINC should be added and YOFSE incremented. This can be repeated as often as necessary to make YIWGTE positive.

Due to the limited amount of memory it is not possible to get valid vertical scaler settings only from the formulae above. In some cases it is necessary to adjust the vertical offsets or the scaler increment to get valid settings.

Tables 6 to 23 show verified settings. They are organised in the following way: The tables are separate for the standard to be encoded, the input resolution and three different anti-flicker filter settings. Each table contains 5 vertical sizes with 5 different offsets. They are intended to be selected according to the current TV set. The corresponding horizontal resolutions of 640 pixels give proper aspect ratios. They can be adjusted according to the formulae above. The next line gives a minimum size intended to fit on the screen under all circumstances. The corresponding horizontal resolution is 620 pixels.

Overscan is only possible with an input resolution of  $800 \times 600$  pixels. Where possible, the corresponding settings are given on the last lines of the tables.

## Digital video encoder

## SAA7102; SAA7103

## 7.18 Input levels and formats

The SAA7102; SAA7103 accepts digital Y, C<sub>B</sub>, C<sub>R</sub> or RGB data with levels (digital codes) in accordance with "ITU-R BT.601"; see Table 24.

For C and CVBS outputs, deviating amplitudes of the colour difference signals can be compensated for by independent gain control setting, while gain for luminance is set to predefined values, distinguishable for 7.5 IRE set-up or without set-up.

The RGB, respectively C<sub>R</sub>-Y-C<sub>B</sub> path features an individual gain setting for luminance (GY) and colour difference signals (GCD). Reference levels are measured with a colour bar, 100% white, 100% amplitude and 100% saturation.

**Table 38** Explanations of Tables 33 to 37

CODE	DESCRIPTION
S	START condition
Sr	repeated START condition
1 0 0 0 1 0 0 X; note 1	slave address
A	acknowledge generated by the slave
Am	acknowledge generated by the master
SUBADDRESS; note 2	subaddress byte
DATA	data byte
-----	continued data bytes and acknowledges
P	STOP condition
RAM ADDRESS	start address for RAM access

**Notes**

1. X is the read/write control bit; X = logic 0 is order to write; X = logic 1 is order to read.
2. If more than 1 byte of DATA is transmitted, then auto-increment of the subaddress is performed.

## 7.21 Slave receiver

**Table 39** Subaddress 16H

DATA BYTE	DESCRIPTION
DACF	output level adjustment fine in 1% steps for all DACs; default after reset is 00H; see Table 40

## Digital video encoder

## SAA7102; SAA7103

**Table 40** Fine adjustment of DAC output voltage

BINARY	GAIN (%)

1111	-7

**Table 41** Subaddresses 17H to 19H

DATA BYTE	DESCRIPTION
RDACC	output level coarse adjustment for RED DAC; default after reset is 1BH for output of C signal 00000b $\equiv$ 0.585 V to 11111b $\equiv$ 1.240 V at 37.5 $\Omega$ nominal for full-scale conversion
GDACC	output level coarse adjustment for GREEN DAC; default after reset is 1BH for output of VBS signal 00000b $\equiv$ 0.585 V to 11111b $\equiv$ 1.240 V at 37.5 $\Omega$ nominal for full-scale conversion
BDACC	output level coarse adjustment for BLUE DAC; default after reset is 1FH for output of CVBS signal 00000b $\equiv$ 0.585 V to 11111b $\equiv$ 1.240 V at 37.5 $\Omega$ nominal for full-scale conversion

**Table 42** Subaddress 1AH

DATA BYTE	DESCRIPTION
MSMT	monitor sense mode threshold for DAC output voltage, should be set to 70

## Digital video encoder

## SAA7102; SAA7103

**Table 43** Subaddress 1BH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
MSM	0	monitor sense mode off; RCOMP, GCOMP and BCOMP bits are not valid; default after reset
	1	monitor sense mode on
RCOMP (read only)	0	check comparator at DAC on pin RED_CR_C is active, output is loaded
	1	check comparator at DAC on pin RED_CR_C is inactive, output is not loaded
GCOMP (read only)	0	check comparator at DAC on pin GREEN_VBS_CVBS is active, output is loaded
	1	check comparator at DAC on pin GREEN_VBS_CVBS is inactive, output is not loaded
BCOMP (read only)	0	check comparator at DAC on pin BLUE_CB_CVBS is active, output is loaded
	1	check comparator at DAC on pin BLUE_CB_CVBS is inactive, output is not loaded

**Table 44** Subaddresses 26H and 27H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
WSS	–	wide screen signalling bits
		3 to 0 = aspect ratio
		7 to 4 = enhanced services
		10 to 8 = subtitles 13 to 11 = reserved
WSSON	0	wide screen signalling output is disabled; default after reset
	1	wide screen signalling output is enabled

**Table 45** Subaddress 28H

DATA BYTE	LOGIC LEVEL	DESCRIPTION	REMARKS
BS	–	starting point of burst in clock cycles	PAL: BS = 33 (21H); default after reset if strapping pin 13 tied to HIGH
			NTSC: BS = 25 (19H); default after reset if strapping pin 13 tied to LOW

**Table 46** Subaddress 29H

DATA BYTE	LOGIC LEVEL	DESCRIPTION	REMARKS
SRES	0	pin TTX_SRES accepts a teletext bit stream (TTX)	default after reset
	1	pin TTX_SRES accepts a sync reset input (SRES)	a HIGH impulse resets synchronization of the encoder (first field, first line)
BE	–	ending point of burst in clock cycles	PAL: BE = 29 (1DH); default after reset if strapping pin FSVGC tied to HIGH
			NTSC: BE = 29 (1DH); default after reset if strapping pin FSVGC tied to LOW

## Digital video encoder

## SAA7102; SAA7103

**Table 47** Subaddresses 2AH to 2CH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
CG	–	LSBs of the respective bytes are encoded immediately after run-in, the MSBs of the respective bytes have to carry the CRCC bits, in accordance with the definition of copy generation management system encoding format.
CGEN	0	copy generation data output is disabled; default after reset
	1	copy generation data output is enabled

**Table 48** Subaddress 2DH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
VBSEN	0	pin GREEN_VBS_CVBS provides a component GREEN signal (CVBSEN1 = 0) or CVBS signal (CVBSEN1 = 1)
	1	pin GREEN_VBS_CVBS provides a luminance (VBS) signal; default after reset
CVBSEN1	0	pin GREEN_VBS_CVBS provides a component GREEN (G) or luminance (VBS) signal; default after reset
	1	pin GREEN_VBS_CVBS provides a CVBS signal
CVBSEN0	0	pin BLUE_CB_CVBS provides a component BLUE (B) or colour difference BLUE (C <sub>B</sub> ) signal
	1	pin BLUE_CB_CVBS provides a CVBS signal; default after reset
CEN	0	pin RED_CR_C provides a component RED (R) or colour difference RED (C <sub>R</sub> ) signal
	1	pin RED_CR_C provides a chrominance signal (C) as modulated subcarrier for S-video; default after reset
ENCOFF	0	encoder is active; default after reset
	1	encoder bypass, DACs are provided with RGB signal after cursor insertion block
CLK2EN	0	pin TTXRQ_XCLKO2 provides a teletext request signal (TTXRQ)
	1	pin TTXRQ_XCLKO2 provides the buffered crystal clock divided by two (13.5 MHz); default after reset

**Table 49** Subaddresses 38H and 39H

DATA BYTE	DESCRIPTION
GY4 to GY0	Gain luminance of RGB (C <sub>R</sub> , Y and C <sub>B</sub> ) output, ranging from $(1 - 16/32)$ to $(1 + 15/32)$ . Suggested nominal value = 0, depending on external application.
GCD4 to GCD0	Gain colour difference of RGB (C <sub>R</sub> , Y and C <sub>B</sub> ) output, ranging from $(1 - 16/32)$ to $(1 + 15/32)$ . Suggested nominal value = 0, depending on external application.

## Digital video encoder

## SAA7102; SAA7103

**Table 50** Subaddress 3AH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
CBENB	0	data from input ports is encoded
	1	colour bar with fixed colours is encoded
SYMP	0	horizontal and vertical trigger is taken from FSVGC or both VSVGC and HSVGC; default after reset
	1	horizontal and vertical trigger is decoded out of "ITU-R BT.656" compatible data at PD port
DEMOFF	0	Y-C <sub>B</sub> -C <sub>R</sub> to RGB dematrix is active; default after reset
	1	Y-C <sub>B</sub> -C <sub>R</sub> to RGB dematrix is bypassed
CSYNC	0	pin 26 provides a horizontal sync for non-interlaced VGA components output (at PIXCLK)
	1	pin 26 provides a composite sync for interlaced components output (at XTAL clock)
Y2C	0	input luminance data is twos complement from PD input port
	1	input luminance data is straight binary from PD input port; default after reset
UV2C	0	input colour difference data is twos complement from PD input port
	1	input colour difference data is straight binary from PD input port; default after reset

**Table 51** Subaddress 54H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
VPSEN	0	video programming system data insertion is disabled; default after reset
	1	video programming system data insertion in line 16 is enabled
EDGE2	0	internal PPD2 data is sampled on the rising clock edge
	1	internal PPD2 data is sampled on the falling clock edge; see Tables 25 to 30; default after reset
EDGE1	0	internal PPD1 data is sampled on the rising clock edge; see Tables 25 to 30; default after reset
	1	internal PPD1 data is sampled on the falling clock edge

**Table 52** Subaddresses 55H to 59H

DATA BYTE	DESCRIPTION	REMARKS
VPS5	fifth byte of video programming system data	in line 16; LSB first; all other bytes are not relevant for VPS
VPS11	eleventh byte of video programming system data	
VPS12	twelfth byte of video programming system data	
VPS13	thirteenth byte of video programming system data	
VPS14	fourteenth byte of video programming system data	

## Digital video encoder

## SAA7102; SAA7103

**Table 53** Subaddress 5AH; note 1

DATA BYTE	DESCRIPTION	VALUE	RESULT
CHPS	phase of encoded colour subcarrier (including burst) relative to horizontal sync; can be adjusted in steps of 360/256 degrees	6BH	PAL B/G and data from input ports in master mode
		16H	PAL B/G and data from look-up table
		25H	NTSC M and data from input ports in master mode
		46H	NTSC M and data from look-up table

**Note**

1. The default after reset is 00H.

**Table 54** Subaddresses 5BH and 5DH

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
GAINU	variable gain for $C_B$ signal; input representation in accordance with "ITU-R BT.601"	white-to-black = 92.5 IRE	$GAINU = -2.17 \times \text{nominal} \text{ to } +2.16 \times \text{nominal}$
		GAINU = 0	output subcarrier of U contribution = 0
		GAINU = 118 (76H)	output subcarrier of U contribution = nominal
		white-to-black = 100 IRE	$GAINU = -2.05 \times \text{nominal} \text{ to } +2.04 \times \text{nominal}$
		GAINU = 0	output subcarrier of U contribution = 0
		GAINU = 125 (7DH)	output subcarrier of U contribution = nominal

**Table 55** Subaddresses 5CH and 5EH

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
GAINV	variable gain for $C_R$ signal; input representation in accordance with "ITU-R BT.601"	white-to-black = 92.5 IRE	$GAINV = -1.55 \times \text{nominal} \text{ to } +1.55 \times \text{nominal}$
		GAINV = 0	output subcarrier of V contribution = 0
		GAINV = 165 (A5H)	output subcarrier of V contribution = nominal
		white-to-black = 100 IRE	$GAINV = -1.46 \times \text{nominal} \text{ to } +1.46 \times \text{nominal}$
		GAINV = 0	output subcarrier of V contribution = 0
		GAINV = 175 (AFH)	output subcarrier of V contribution = nominal

**Table 56** Subaddress 5DH

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
BLCKL	variable black level; input representation in accordance with "ITU-R BT.601"	white-to-sync = 140 IRE; note 1	recommended value: BLCKL = 58 (3AH)
		BLCKL = 0; note 1	output black level = 29 IRE
		BLCKL = 63 (3FH); note 1	output black level = 49 IRE
		white-to-sync = 143 IRE; note 2	recommended value: BLCKL = 51 (33H)
		BLCKL = 0; note 2	output black level = 27 IRE
		BLCKL = 63 (3FH); note 2	output black level = 47 IRE

**Notes**

1. Output black level/IRE =  $BLCKL \times 2/6.29 + 28.9$ .
2. Output black level/IRE =  $BLCKL \times 2/6.18 + 26.5$ .

## Digital video encoder

## SAA7102; SAA7103

**Table 57** Subaddress 5EH

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
BLNNL	variable blanking level	white-to-sync = 140 IRE; note 1	recommended value: BLNNL = 46 (2EH)
		BLNNL = 0; note 1	output blanking level = 25 IRE
		BLNNL = 63 (3FH); note 1	output blanking level = 45 IRE
		white-to-sync = 143 IRE; note 2	recommended value: BLNNL = 53 (35H)
		BLNNL = 0; note 2	output blanking level = 26 IRE
		BLNNL = 63 (3FH); note 2	output blanking level = 46 IRE

**Notes**

- Output black level/IRE =  $BLNNL \times 2/6.29 + 25.4$ .
- Output black level/IRE =  $BLNNL \times 2/6.18 + 25.9$ ; default after reset: 35H.

**Table 58** Subaddress 5FH

DATA BYTE	DESCRIPTION
CCRS	select cross-colour reduction filter in luminance; see Table 59
BLNVB	variable blanking level during vertical blanking interval is typically identical to value of BLNNL

**Table 59** Logic levels and function of CCRS

CCRS1	CCRS0	DESCRIPTION
0	0	no cross-colour reduction; for overall transfer characteristic of luminance see Fig.6
0	1	cross-colour reduction #1 active; for overall transfer characteristic see Fig.6
1	0	cross-colour reduction #2 active; for overall transfer characteristic see Fig.6
1	1	cross-colour reduction #3 active; for overall transfer characteristic see Fig.6

**Table 60** Subaddress 61H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
DOWND	0	digital core in normal operational mode; default after reset
	1	digital core in sleep mode and is reactivated with an I <sup>2</sup> C-bus address
DOWNA	0	DACs in normal operational mode; default after reset
	1	DACs in Power-down mode
YGS	0	luminance gain for white – black 100 IRE
	1	luminance gain for white – black 92.5 IRE including 7.5 IRE set-up of black
SCBW	0	enlarged bandwidth for chrominance encoding (for overall transfer characteristic of chrominance in baseband representation see Figs 4 and 5)
	1	standard bandwidth for chrominance encoding (for overall transfer characteristic of chrominance in baseband representation see Figs 4 and 5); default after reset
PAL	0	NTSC encoding (non-alternating V component)
	1	PAL encoding (alternating V component)
FISE	0	864 total pixel clocks per line
	1	858 total pixel clocks per line

## Digital video encoder

## SAA7102; SAA7103

**Table 61** Subaddress 62H

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
BSTA	amplitude of colour burst; input representation in accordance with "ITU-R BT.601"	white-to-black = 92.5 IRE; burst = 40 IRE; NTSC encoding BSTA = 0 to $2.02 \times$ nominal	recommended value: BSTA = 63 (3FH)
		white-to-black = 92.5 IRE; burst = 40 IRE; PAL encoding BSTA = 0 to $2.82 \times$ nominal	recommended value: BSTA = 45 (2DH)
		white-to-black = 100 IRE; burst = 43 IRE; NTSC encoding BSTA = 0 to $1.90 \times$ nominal	recommended value: BSTA = 67 (43H)
		white-to-black = 100 IRE; burst = 43 IRE; PAL encoding BSTA = 0 to $3.02 \times$ nominal	recommended value: BSTA = 47 (2FH); default after reset

**Table 62** Subaddresses 63H to 66H (four bytes to program subcarrier frequency)

DATA BYTE	DESCRIPTION	CONDITIONS	REMARKS
FSC0 to FSC3	$f_{\text{fsc}}$ = subcarrier frequency (in multiples of line frequency); $f_{\text{llc}}$ = clock frequency (in multiples of line frequency)	$\text{FSC} = \text{round}\left(\frac{f_{\text{fsc}}}{f_{\text{llc}}} \times 2^{32}\right)$ ; note 1	FSC3 = most significant byte; FSC0 = least significant byte

**Note**

## 1. Examples:

- a) NTSC M:  $f_{\text{fsc}} = 227.5$ ,  $f_{\text{llc}} = 1716 \rightarrow \text{FSC} = 569408543$  (21F07C1FH).
- b) PAL B/G:  $f_{\text{fsc}} = 283.7516$ ,  $f_{\text{llc}} = 1728 \rightarrow \text{FSC} = 705268427$  (2A098ACBH).

**Table 63** Subaddresses 67H to 6AH

DATA BYTE	DESCRIPTION	REMARKS
L2100	first byte of captioning data, odd field	LSBs of the respective bytes are encoded immediately after run-in and framing code, the MSBs of the respective bytes have to carry the parity bit, in accordance with the definition of line 21 encoding format.
L2101	second byte of captioning data, odd field	
L21E0	first byte of extended data, even field	
L21E1	second byte of extended data, even field	

**Table 64** Subaddresses 6CH and 6DH

DATA BYTE	DESCRIPTION
HTRIG	sets the horizontal trigger phase related to chip-internal horizontal input values above 1715 (FISE = 1) or 1727 (FISE = 0) are not allowed; increasing HTRIG decreases delays of all internally generated timing signals; the default value is 0

## Digital video encoder

## SAA7102; SAA7103

**Table 65** Subaddress 6DH

DATA BYTE	DESCRIPTION
VTRIG	sets the vertical trigger phase related to chip-internal vertical input increasing VTRIG decreases delays of all internally generated timing signals, measured in half lines; variation range of VTRIG = 0 to 31 (1FH); the default value is 0

**Table 66** Subaddress 6EH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
BLCKON	0	encoder in normal operation mode; default after reset
	1	output signal is forced to blanking level
PHRES	–	selects the phase reset mode of the colour subcarrier generator; see Table 67
LDEL	–	selects the delay on luminance path with reference to chrominance path; see Table 68
FLC	–	field length control; see Table 69

**Table 67** Logic levels and function of PHRES

DATA BYTE		DESCRIPTION
PHRES1	PHRES0	
0	0	no subcarrier reset
0	1	subcarrier reset every two lines
1	0	subcarrier reset every eight fields
1	1	subcarrier reset every four fields

**Table 68** Logic levels and function of LDEL

DATA BYTE		DESCRIPTION
LDEL1	LDEL0	
0	0	no luminance delay; default after reset
0	1	1 LLC luminance delay
1	0	2 LLC luminance delay
1	1	3 LLC luminance delay

**Table 69** Logic levels and function of FLC

DATA BYTE		DESCRIPTION
FLC1	FLC0	
0	0	interlaced 312.5 lines/field at 50 Hz, 262.5 lines/field at 60 Hz; default after reset
0	1	non-interlaced 312 lines/field at 50 Hz, 262 lines/field at 60 Hz
1	0	non-interlaced 313 lines/field at 50 Hz, 263 lines/field at 60 Hz
1	1	non-interlaced 313 lines/field at 50 Hz, 263 lines/field at 60 Hz

## Digital video encoder

## SAA7102; SAA7103

**Table 70** Subaddress 6FH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
CCEN	–	enables individual line 21 encoding; see Table 71
TTXEN	0	disables teletext insertion; default after reset
	1	enables teletext insertion
SCCLN	–	selects the actual line, where Closed Caption or extended data are encoded; line = (SCCLN + 4) for M-systems; line = (SCCLN + 1) for other systems

**Table 71** Logic levels and function of CCEN

DATA BYTE		DESCRIPTION
CCEN1	CCEN0	
0	0	line 21 encoding off; default after reset
0	1	enables encoding in field 1 (odd)
1	0	enables encoding in field 2 (even)
1	1	enables encoding in both fields

**Table 72** Subaddresses 70H to 72H

DATA BYTE	DESCRIPTION
ADWHS	active display window horizontal start; defines the start of the active TV display portion after the border colour values above 1715 (FISE = 1) or 1727 (FISE = 0) are not allowed
ADWHE	active display window horizontal end; defines the end of the active TV display portion before the border colour values above 1715 (FISE = 1) or 1727 (FISE = 0) are not allowed

**Table 73** Subaddress 73H

DATA BYTE	DESCRIPTION	REMARKS
TTXHS	start of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0); see Fig.14	TTXHS = 42H; is default after reset if strapped to PAL
		TTXHS = 54H; is default after reset if strapped to NTSC

**Table 74** Subaddress 74H

DATA BYTE	DESCRIPTION	REMARKS
TTXHD	indicates the delay in clock cycles between rising edge of TTXRQ output signal on pin TTXRQ_XCLKO2 (CLK2EN = 0) and valid data at pin TTX_SRES	minimum value: TTXHD = 2; is default after reset

**Table 75** Subaddress 75H

DATA BYTE	DESCRIPTION
CSYNCA	advanced composite sync against RGB output from 0 XTAL clocks to 31 XTAL clocks

## Digital video encoder

## SAA7102; SAA7103

**Table 76** Subaddresses 76H, 77H and 7CH

DATA BYTE	DESCRIPTION	REMARKS
TTXOVS	first line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in odd field line = (TTXOVS + 4) for M-systems line = (TTXOVS + 1) for other systems	TTXOVS = 05H; is default after reset if strapped to PAL TTXOVS = 06H; is default after reset if strapped to NTSC
TTXOVE	last line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in odd field line = (TTXOVE + 3) for M-systems line = TTXOVE for other systems	TTXOVE = 16H; is default after reset if strapped to PAL TTXOVE = 10H; is default after reset if strapped to NTSC

**Table 77** Subaddresses 78H, 79H and 7CH

DATA BYTE	DESCRIPTION	REMARKS
TTXEVS	first line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in even field line = (TTXEVS + 4) for M-systems line = (TTXEVS + 1) for other systems	TTXEVS = 04H; is default after reset if strapped to PAL TTXEVS = 05H; is default after reset if strapped to NTSC
TTXEVE	last line of occurrence of signal TTXRQ on pin TTXRQ_XCLKO2 (CLK2EN = 0) in even field line = (TTXEVE + 3) for M-systems line = TTXEVE for other systems	TTXEVE = 16H; is default after reset if strapped to PAL TTXEVE = 10H; is default after reset if strapped to NTSC

**Table 78** Subaddresses 7AH to 7CH

DATA BYTE	DESCRIPTION
FAL	first active line = FAL + 4 for M-systems and FAL + 1 for other systems, measured in lines FAL = 0 coincides with the first field synchronization pulse
LAL	last active line = LAL + 3 for M-systems and LAL for other system, measured in lines LAL = 0 coincides with the first field synchronization pulse

**Table 79** Subaddress 7CH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
TTX60	0	enables NABTS (FISE = 1) or European TTX (FISE = 0); default after reset
	1	enables world standard teletext 60 Hz (FISE = 1)

**Table 80** Subaddresses 7EH and 7FH

DATA BYTE	DESCRIPTION
LINE	individual lines in both fields (PAL counting) can be disabled for insertion of teletext by the respective bits, disabled line = LINE <sub>xx</sub> (50 Hz field rate) this bit mask is effective only if the lines are enabled by TTXOVS/TTXOVE and TTXEVS/TTXEVE

## Digital video encoder

## SAA7102; SAA7103

**Table 81** Subaddresses 81H to 83H

DATA BYTE	DESCRIPTION
PCL	defines the frequency of the synthesized pixel clock PIXCLKO; $f_{\text{PIXCLK}} = \left( \frac{\text{PCL}}{2^{24}} \times f_{\text{XTAL}} \right) \times 8$ ; $f_{\text{XTAL}} = 27$ MHz nominal, e.g. 640 × 480 to NTSC M: PCL = 20F63BH; 640 × 480 to PAL B/G: PCL = 1B5A73H (as by strapping pins)

**Table 82** Subaddresses 90H and 94H

DATA BYTE	DESCRIPTION
XOFS	horizontal offset; defines the number of PIXCLKs from horizontal sync (HSVGC) output to composite blanking (CBO) output

**Table 83** Subaddresses 91H and 94H

DATA BYTE	DESCRIPTION
XPIX	pixel in X direction; defines half the number of active pixels per input line (identical to the length of CBO pulses)

**Table 84** Subaddresses 92H and 94H

DATA BYTE	DESCRIPTION
YOFSO	vertical offset in odd field; defines (in the odd field) the number of lines from VSVGC to first line with active CBO; if no LUT data is requested, the first active CBO will be output at YOFSO + 2; usually, YOFSO = YOFSE with the exception of extreme vertical downscaling and interlacing

**Table 85** Subaddresses 93H and 94H

DATA BYTE	DESCRIPTION
YOFSE	vertical offset in even field; defines (in the even field) the number of lines from VSVGC to first line with active CBO; if no LUT data is requested, the first active CBO will be output at YOFSE + 2; usually, YOFSE = YOFSO with the exception of extreme vertical downscaling and interlacing

**Table 86** Subaddresses 95H and 96H

DATA BYTE	DESCRIPTION
YPIX	defines the number of requested input lines from the feeding device; number of requested lines = YPIX + YOFSE – YOFSO

## Digital video encoder

## SAA7102; SAA7103

Table 87 Subaddress 96H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
EFS	0	frame sync signal at pin FSVGC ignored in slave mode
	1	frame sync signal at pin FSVGC accepted in slave mode
PCBN	0	normal polarity of $\overline{CBO}$ signal (HIGH during active video)
	1	inverted polarity of $\overline{CBO}$ signal (LOW during active video)
SLAVE	0	the SAA7102; SAA7103 is timing master to the graphics controller
	1	the SAA7102; SAA7103 is timing slave to the graphics controller
ILC	0	if hardware cursor insertion is active, set LOW for non-interlaced input signals
	1	if hardware cursor insertion is active, set HIGH for interlaced input signals
YFIL	0	luminance sharpness booster disabled
	1	luminance sharpness booster enabled
HSL	0	normal trigger event handling of the horizontal state machine, if the SAA7102; SAA7103 is slave to HSVGC input
	1	trigger event for horizontal state machine is shifted 128 PIXCLKs in advance, adapted to a late HSVGC in slave mode

Table 88 Subaddress 97H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
HFS	0	horizontal sync is directly derived from input signal (slave mode) at pin HSVGC
	1	horizontal sync is derived from a frame sync signal (slave mode) at pin FSVGC (only if EFS is set HIGH)
VFS	0	vertical sync (field sync) is directly derived from input signal (slave mode) at pin VSVGC
	1	vertical sync (field sync) is derived from a frame sync signal (slave mode) at pin FSVGC (only if EFS is set HIGH)
OFS	0	pin FSVGC is switched to input
	1	pin FSVGC is switched to active output
PFS	0	polarity of signal at pin FSVGC in output mode (master mode) is active HIGH; rising edge of the input signal is used in slave mode
	1	polarity of signal at pin FSVGC in output mode (master mode) is active LOW; falling edge of the input signal is used in slave mode
OVS	0	pin VSVGC is switched to input
	1	pin VSVGC is switched to active output
PVS	0	polarity of signal at pin VSVGC in output mode (master mode) is active HIGH; rising edge of the input signal is used in slave mode
	1	polarity of signal at pin VSVGC in output mode (master mode) is active LOW; falling edge of the input signal is used in slave mode

## Digital video encoder

## SAA7102; SAA7103

DATA BYTE	LOGIC LEVEL	DESCRIPTION
OHS	0	pin HSVGC is switched to input
	1	pin HSVGC is switched to active output
PHS	0	polarity of signal at pin HSVGC in output mode (master mode) is active HIGH; rising edge of the input signal is used in slave mode
	1	polarity of signal at pin HSVGC in output mode (master mode) is active LOW; falling edge of the input signal is used in slave mode

**Table 89** Subaddresses 98H and 99H

DATA BYTE	DESCRIPTION
HLEN	horizontal length; $HLEN = \frac{\text{number of PIXCLKs}}{\text{line}} - 1$

**Table 90** Subaddress 99H

DATA BYTE	DESCRIPTION
IDEL	input delay; defines the distance in PIXCLKs between the active edge of $\overline{CBO}$ and the first received valid pixel

**Table 91** Subaddresses 9AH and 9CH

DATA BYTE	DESCRIPTION
XINC	incremental fraction of the horizontal scaling engine; $XINC = \frac{\frac{\text{number of output pixels}}{\text{line}}}{\frac{\text{number of input pixels}}{\text{line}}} \times 4096$

**Table 92** Subaddresses 9BH and 9CH

DATA BYTE	DESCRIPTION
YINC	incremental fraction of the vertical scaling engine; $YINC = \frac{\text{number of active output lines}}{\text{number of active input lines}} \times 4096$

**Table 93** Subaddresses 9DH and 9FH

DATA BYTE	DESCRIPTION
YIWGTO	weighting factor for the first line of the odd field; $YIWGTO = \frac{YINC}{2} + 2048$

**Table 94** Subaddresses 9EH and 9FH

DATA BYTE	DESCRIPTION
YIWGTE	weighting factor for the first line of the even field; $YIWGTE = \frac{YINC - YSKIP}{2}$

## Digital video encoder

## SAA7102; SAA7103

**Table 95** Subaddresses A0H and A1H

DATA BYTE	DESCRIPTION
YSKIP	vertical line skip; defines the effectiveness of the anti-flicker filter; YSKIP = 0: most effective; YSKIP = 4095: anti-flicker filter switched off

**Table 96** Subaddress A1H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
BLEN	0	no internal blanking for non-interlaced graphics in bypass mode; default after reset
	1	forced internal blanking for non-interlaced graphics in bypass mode

**Table 97** Subaddresses A2H to A4H

DATA BYTE	DESCRIPTION
BCY, BCU and BCV	luminance and colour difference portion of border colour in underscan area

**Table 98** Subaddresses F0H to F2H

DATA BYTE	DESCRIPTION
CC1R, CC1G and CC1B	RED, GREEN and BLUE portion of first cursor colour

**Table 99** Subaddresses F3H to F5H

DATA BYTE	DESCRIPTION
CC2R, CC2G and CC2B	RED, GREEN and BLUE portion of second cursor colour

**Table 100** Subaddresses F6H to F8H

DATA BYTE	DESCRIPTION
AUXR, AUXG and AUXB	RED, GREEN and BLUE portion of auxiliary cursor colour

**Table 101** Subaddresses F9H and FAH

DATA BYTE	DESCRIPTION
XCP	horizontal cursor position

**Table 102** Subaddress FAH

DATA BYTE	DESCRIPTION
XHS	horizontal hot spot of cursor

**Table 103** Subaddresses FBH and FCH

DATA BYTE	DESCRIPTION
YCP	vertical cursor position

## Digital video encoder

## SAA7102; SAA7103

Table 104 Subaddress FCH

DATA BYTE	DESCRIPTION
YHS	vertical hot spot of cursor

Table 105 Subaddress FDH

DATA BYTE	LOGIC LEVEL	DESCRIPTION
LUTOFF	0	colour look-up table is active
	1	colour look-up table is bypassed
CMODE	0	cursor mode; input colour will be inverted
	1	auxiliary cursor colour will be inserted
LUTL	0	LUT loading via input data stream is inactive
	1	colour and cursor LUTs are loaded via input data stream
IF	0	input format is 8 + 8 + 8-bit 4 : 4 : 4 non-interlaced RGB or C <sub>B</sub> -Y-C <sub>R</sub>
	1	input format is 5 + 5 + 5-bit 4 : 4 : 4 non-interlaced RGB
	2	input format is 5 + 6 + 5-bit 4 : 4 : 4 non-interlaced RGB
	3	input format is 8 + 8 + 8-bit 4 : 2 : 2 non-interlaced C <sub>B</sub> -Y-C <sub>R</sub>
	4	input format is 8 + 8 + 8-bit 4 : 2 : 2 interlaced C <sub>B</sub> -Y-C <sub>R</sub> (ITU-R BT.656, 27 MHz clock) (in subaddresses 91H and 94H set XPIX = number of active pixels/line)
	5	input format is 8-bit non-interlaced index colour
	6	input format is 8 + 8 + 8-bit 4 : 4 : 4 non-interlaced RGB or C <sub>B</sub> -Y-C <sub>R</sub> (special bit ordering)
MATOFF	0	RGB to C <sub>R</sub> -Y-C <sub>B</sub> matrix is active
	1	RGB to C <sub>R</sub> -Y-C <sub>B</sub> matrix is bypassed
DFOFF	0	down formatter (4 : 4 : 4 to 4 : 2 : 2) in input path is active
	1	down formatter is bypassed

Table 106 Subaddress FEH

DATA BYTE	DESCRIPTION
CURSA	RAM start address for cursor bit map; the byte following subaddress FEH points to the first cell to be loaded with the next transmitted byte; succeeding cells are loaded by auto-incrementing until stop condition

Table 107 Subaddress FFH

DATA BYTE	DESCRIPTION
COLSA	RAM start address for colour LUT; the byte following subaddress FFH points to the first cell to be loaded with the next transmitted byte; succeeding cells are loaded by auto-incrementing until stop condition

In subaddresses 5BH, 5CH, 5DH, 5EH and 62H all IRE values are rounded up.

## Digital video encoder

## SAA7102; SAA7103

## 7.22 Slave transmitter

Table 108 Slave transmitter (slave address 89H)

REGISTER FUNCTION	SUBADDRESS	DATA BYTE							
		D7	D6	D5	D4	D3	D2	D1	D0
Status byte	00H	VER2	VER1	VER0	CCRDO	CCRDE	0	FSEQ	O_E

FIFO status	80H	0	0	0	0	0	0	OVFL	UDFL

Table 109 Subaddress 00H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
VER	–	version identification of the device: it will be changed with all versions of the IC that have different programming models; current version is 010 binary
CCRDO	1	Closed Caption bytes of the odd field have been encoded
	0	the bit is reset after information has been written to the subaddresses 67H and 68H; it is set immediately after the data has been encoded
CCRDE	1	Closed Caption bytes of the even field have been encoded
	0	the bit is reset after information has been written to the subaddresses 69H and 6AH; it is set immediately after the data has been encoded
FSEQ	1	during first field of a sequence (repetition rate: NTSC = 4 fields, PAL = 8 fields)
	0	not first field of a sequence
O_E	1	during even field
	0	during odd field

Table 110 Subaddress 1CH

DATA BYTE	DESCRIPTION
CID	chip ID of SAA7102 = 02H; chip ID of SAA7103 = 03H

Table 111 Subaddress 80H

DATA BYTE	LOGIC LEVEL	DESCRIPTION
OVFL	0	no FIFO overflow
	1	FIFO overflow has occurred; this bit is reset after this subaddress has been read
UDFL	0	no FIFO underflow
	1	FIFO underflow has occurred; this bit is reset after this subaddress has been read

## SAA7102; SAA7103

**8 BOUNDARY SCAN TEST**

The SAA7102; SAA7103 has built-in logic and 5 dedicated pins to support boundary scan testing which allows board testing without special hardware (nails). The SAA7102; SAA7103 follows the “*IEEE Std. 1149.1 - Standard Test Access Port and Boundary-Scan Architecture*” set by the Joint Test Action Group (JTAG) chaired by Philips.

The 5 special pins are Test Mode Select (TMS), Test Clock (TCK), Test Reset ( $\overline{\text{TRST}}$ ), Test Data Input (TDI) and Test Data Output (TDO).

The Boundary Scan Test (BST) functions BYPASS, EXTEST, INTEST, SAMPLE, CLAMP and IDCODE are all supported; see Table 112. Details about the JTAG BST-TEST can be found in the specification “*IEEE Std. 1149.1*”. A file containing the detailed Boundary Scan Description Language (BSDL) of the SAA7102; SAA7103 is available on request.

**Table 112** BST instructions supported by the SAA7102; SAA7103

INSTRUCTION	DESCRIPTION
BYPASS	This mandatory instruction provides a minimum length serial path (1 bit) between TDI and TDO when no test operation of the component is required.
EXTEST	This mandatory instruction allows testing of off-chip circuitry and board level interconnections.
SAMPLE	This mandatory instruction can be used to take a sample of the inputs during normal operation of the component. It can also be used to preload data values into the latched outputs of the boundary scan register.
CLAMP	This optional instruction is useful for testing when not all ICs have BST. This instruction addresses the bypass register while the boundary scan register is in external test mode.
IDCODE	This optional instruction will provide information on the components manufacturer, part number and version number.
INTEST	This optional instruction allows testing of the internal logic (no support for customer available).
USER1	This private instruction allows testing by the manufacturer (no support for customer available).

**8.1 Initialization of boundary scan circuit**

The Test Access Port (TAP) controller of an IC should be in the reset state (TEST\_LOGIC\_RESET) when the IC is in functional mode. This reset state also forces the instruction register into a functional instruction such as IDCODE or BYPASS.

To solve the power-up reset, the standard specifies that the TAP controller will be forced asynchronously to the TEST\_LOGIC\_RESET state by setting the  $\overline{\text{TRST}}$  pin LOW.

**8.2 Device identification codes**

A device identification register is specified in “*IEEE Std. 1149.1b-1994*”. It is a 32-bit register which contains fields for the specification of the IC manufacturer, the IC part number and the IC version number. Its biggest advantage is the possibility to check for the correct ICs mounted after production and to determine the version number of the ICs during field service.

When the IDCODE instruction is loaded into the BST instruction register, the identification register will be connected between TDI and TDO of the IC. The identification register will load a component specific code during the CAPTURE\_DATA\_REGISTER state of the TAP controller, this code can subsequently be shifted out. At board level this code can be used to verify component manufacturer, type and version number. The device identification register contains 32 bits, numbered 31 to 0, where bit 31 is the most significant bit (nearest to TDI) and bit 0 is the least significant bit (nearest to TDO); see Fig.10.

**9 LIMITING VALUES**

In accordance with the Absolute Maximum Rating System (IEC 60134); all ground pins connected together and grounded (0 V); all supply pins connected together.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
$V_{DDD}$	digital supply voltage		-0.5	+4.6	V
$V_{DDA}$	analog supply voltage		-0.5	+4.6	V
$V_{i(A)}$	input voltage at analog inputs		-0.5	+4.6	V
$V_{i(n)}$	input voltage at pins XTALI, SDA and SCL		-0.5	$V_{DDD} + 0.5$	V
$V_{i(D)}$	input voltage at digital inputs or I/O pins	outputs in 3-state	-0.5	+4.6	V
		outputs in 3-state; note 1	-0.5	+5.5	V
$\Delta V_{SS}$	voltage difference between $V_{SSA(n)}$ and $V_{SSD(n)}$		-	100	mV
$T_{stg}$	storage temperature		-65	+150	°C
$T_{amb}$	ambient temperature		0	70	°C
$V_{esd}$	electrostatic discharge voltage	human body model; note 2	-	$\pm 2000$	V
		machine model; note 3	-	$\pm 150$	V

**Notes**

1. Condition for maximum voltage at digital inputs or I/O pins:  $3.0\text{ V} < V_{DDD} < 3.6\text{ V}$ .
2. Class 2 according to EIA/JESD22-114-B.
3. Class A according to EIA/JESD22-115-A.

**10 THERMAL CHARACTERISTICS**

SYMBOL	PARAMETER	CONDITIONS	VALUE	UNIT
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air		
	SAA7102E		38 <sup>(1)</sup>	K/W
	SAA7103E		38 <sup>(1)</sup>	K/W
	SAA7102H		53 <sup>(1)</sup>	K/W
	SAA7103H		53 <sup>(1)</sup>	K/W

**Note**

1. The overall  $R_{th(j-a)}$  value can vary depending on the board layout. To minimize the effective  $R_{th(j-a)}$  all power and ground pins must be connected to the power and ground layers directly. An ample copper area direct under the SAA7102; SAA7103 with a number of through-hole plating, which connect to the ground layer (four-layer board: second layer), can also reduce the effective  $R_{th(j-a)}$ . Please do not use any solder-stop varnish under the chip. In addition the usage of soldering glue with a high thermal conductance after curing is recommended.

## Digital video encoder

Fig.13 Vertical input timing.

# Digital video encoder

# SAA7102; SAA7103

## 11.1 Teletext timing

Time  $t_{FD}$  is the time needed to interpolate input data TTX and insert it into the CVBS and VBS output signal, such that it appears at  $t_{TTX} = 9.78 \mu s$  (PAL) or  $t_{TTX} = 10.5 \mu s$  (NTSC) after the leading edge of the horizontal synchronization pulse.

Time  $t_{PD}$  is the pipeline delay time introduced by the source that is gated by TTXRQ\_XCLKO2 in order to deliver TTX data. This delay is programmable by register TTXHD. For every active HIGH state at output pin TTXRQ\_XCLKO2, a new teletext bit must be provided by the source.

Since the beginning of the pulses representing the TTXRQ signal and the delay between the rising edge of TTXRQ and valid teletext input data are fully programmable (TTXHS and TTXHD), the TTX data is always inserted at the correct position after the leading edge of the outgoing horizontal synchronization pulse.

Time  $t_{i(TTXW)}$  is the internally used insertion window for TTX data; it has a constant length that allows insertion of 360 teletext bits at a text data rate of 6.9375 Mbits/s (PAL), 296 teletext bits at a text data rate of 5.7272 Mbits/s (world standard TTX) or 288 teletext bits at a text data rate of 5.7272 Mbits/s (NABTS). The insertion window is not opened if the control bit TTXEN is zero.

Using appropriate programming, all suitable lines of the odd field (TTXOVS and TTXOVE) plus all suitable lines of the even field (TTXEVS and TTXEVE) can be used for teletext insertion.

**It is essential to note that the two pins used for teletext insertion must be configured for this purpose by the correct I<sup>2</sup>C-bus register settings.**

Fig.14 Teletext timing.

Digital video encoder

12 APPLICATION INFORMATION

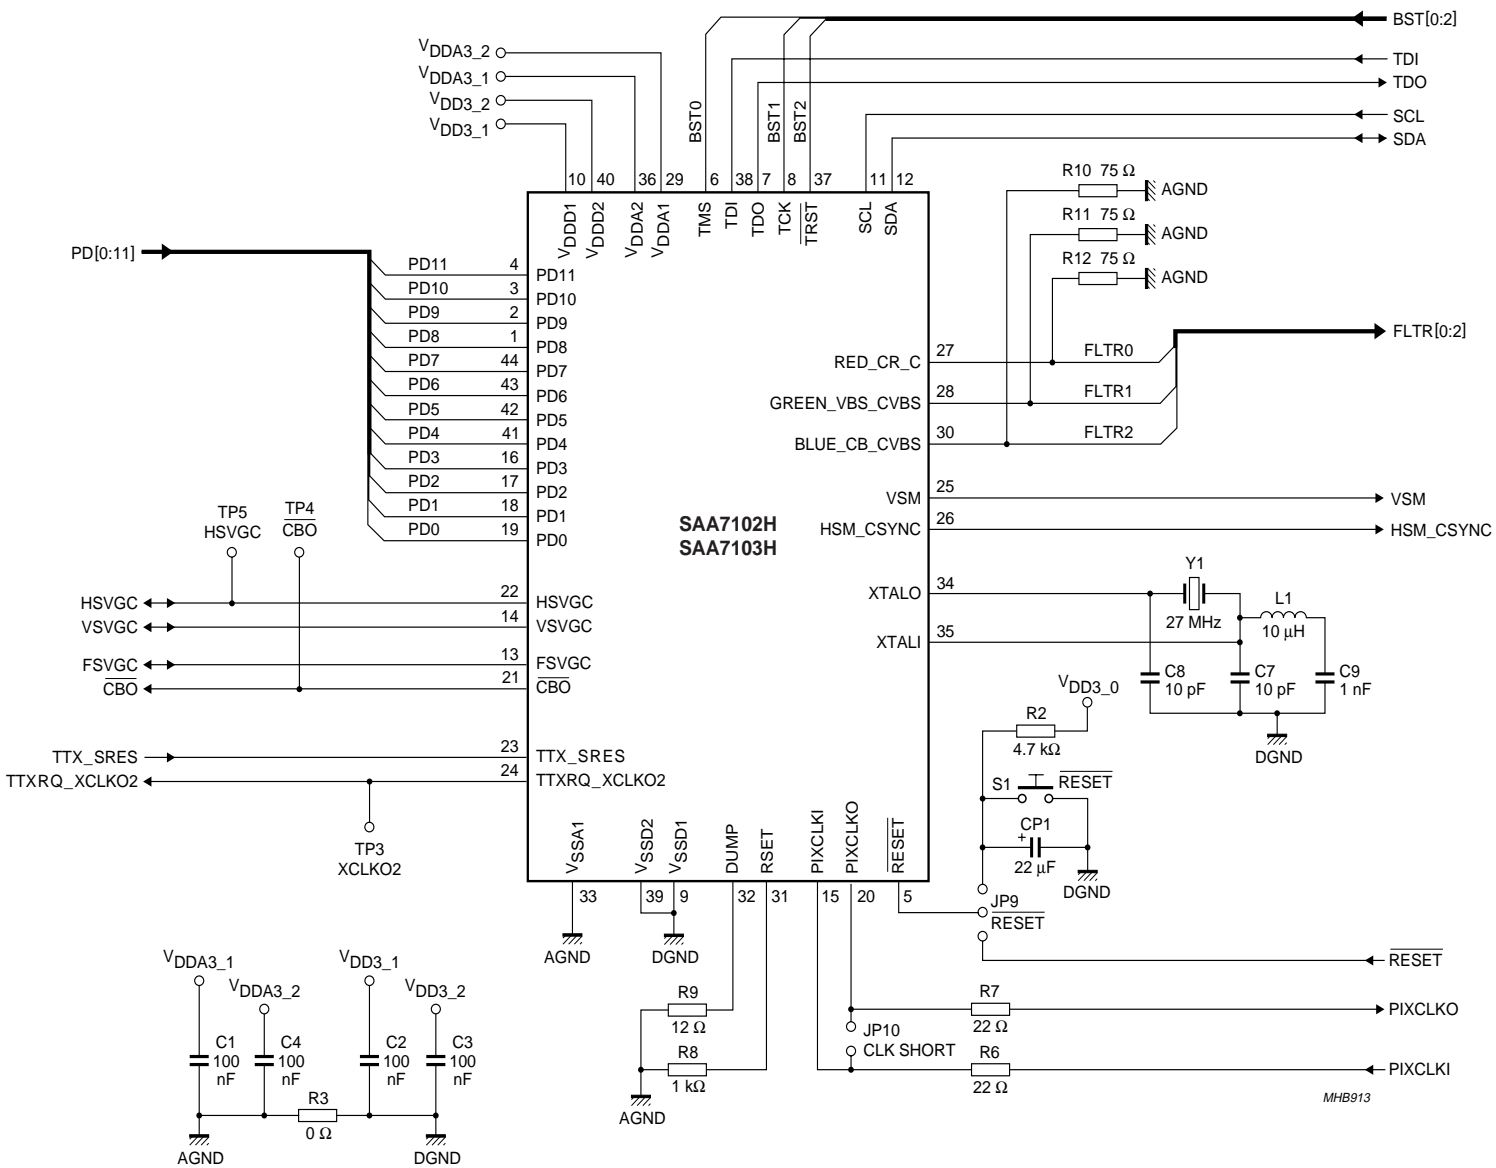

Fig.15 Application circuit.

Digital video encoder

SAA7102; SAA7103

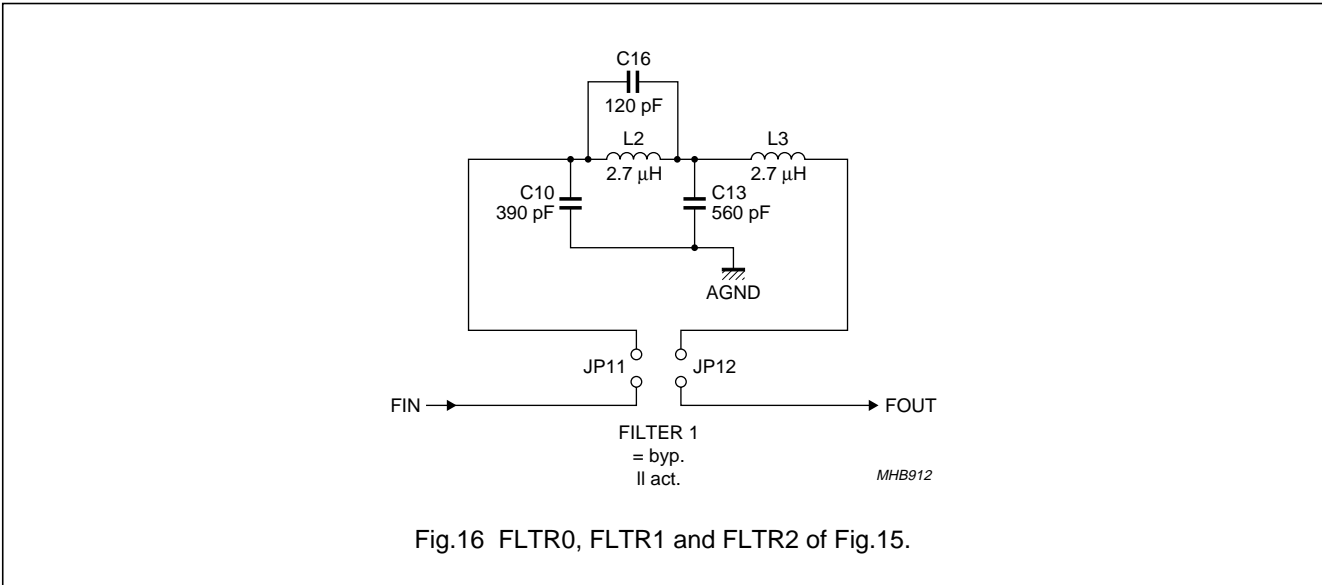

Fig.16 FLTR0, FLTR1 and FLTR2 of Fig.15.

12.1 Analog output voltages

The analog output voltages are dependent on the total load (typical value 37.5 Ω), the digital gain parameters and the I<sup>2</sup>C-bus settings of the DAC reference currents (analog settings).

The digital output signals in front of the DACs under nominal (nominal here stands for the settings given in Tables 54 to 61 for example a standard PAL or NTSC signal) conditions occupy different conversion ranges, as indicated in Table 113 for a 100/100 colour bar signal.

By setting the reference currents of the DACs as shown in Table 113, standard compliant amplitudes can be achieved for all signal combinations; it is assumed that in subaddress 16H, parameter DACF = 0000b, that means the fine adjustment for all DACs in common is set to 0%.

If S-video output is desired, the adjustment for the C (chrominance subcarrier) output should be identical to the one for VBS (luminance plus sync) output.

Table 113 Digital output signals conversion range

SET/OUT	CVBS, SYNC TIP-TO-WHITE	VBS, SYNC TIP-TO-WHITE	RGB, BLACK-TO-WHITE
Digital settings	see Tables 54 to 61	see Tables 54 to 61	see Table 49
Digital output	1014	881	876
Analog settings	e.g. B DAC = 1FH	e.g. G DAC = 1BH	e.g. R DAC = G DAC = B DAC = 0BH
Analog output	1.23 V (p-p)	1.00 V (p-p)	0.70 V (p-p)

12.2 Suggestions for a board layout

Use separate ground planes for analog and digital ground. Connect these planes only at one point directly under the device, by using a 0 Ω resistor directly at the supply stage. Use separate supply lines for the analog and digital supply. Place the supply decoupling capacitors close to the supply pins.

Use L<sub>bead</sub> (ferrite coil) in each digital supply line close to the decoupling capacitors to minimize radiation energy (EMC).

Place the analog coupling (clamp) capacitors close to the analog input pins. Place the analog termination resistors close to the coupling capacitors.

Be careful of hidden layout capacitors around the crystal application.

Use serial resistors in clock, sync and data lines, to avoid clock or data reflection effects and to soften data energy.

### 14 SOLDERING

#### 14.1 Introduction

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (document order number 9398 652 90011).

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mount components are mixed on one printed-circuit board. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

#### 14.2 Through-hole mount packages

##### 14.2.1 SOLDERING BY DIPPING OR BY SOLDER WAVE

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg(max)}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

##### 14.2.2 MANUAL SOLDERING

Apply the soldering iron (24 V or less) to the lead(s) of the package, either below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

#### 14.3 Surface mount packages

##### 14.3.1 REFLOW SOLDERING

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven.

Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
  - for all the BGA, HTSSON..T and SSOP-T packages
  - for packages with a thickness  $\geq 2.5$  mm
  - for packages with a thickness  $< 2.5$  mm and a volume  $\geq 350$  mm<sup>3</sup> so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness  $< 2.5$  mm and a volume  $< 350$  mm<sup>3</sup> so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

##### 14.3.2 WAVE SOLDERING

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

---

## Digital video encoder

## SAA7102; SAA7103

---

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
  - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive.

The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

### 14.3.3 MANUAL SOLDERING

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

## Digital video encoder

## SAA7102; SAA7103

## 14.4 Suitability of IC packages for wave, reflow and dipping soldering methods

MOUNTING	PACKAGE <sup>(1)</sup>	SOLDERING METHOD		
		WAVE	REFLOW <sup>(2)</sup>	DIPPING
Through-hole mount	CPGA, HCPGA	suitable	–	suitable
	DBS, DIP, HDIP, RDBS, SDIP, SIL	suitable <sup>(3)</sup>	–	–
Through-hole-surface mount	PMFP <sup>(4)</sup>	not suitable	not suitable	–
Surface mount	BGA, HTSSON..T <sup>(5)</sup> , LBGA, LFBGA, SQFP, SSOP-T <sup>(5)</sup> , TFBGA, USON, VFBGA	not suitable	suitable	–
	DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable <sup>(6)</sup>	suitable	–
	PLCC <sup>(7)</sup> , SO, SOJ	suitable	suitable	–
	LQFP, QFP, TQFP	not recommended <sup>(7)(8)</sup>	suitable	–
	SSOP, TSSOP, VSO, VSSOP	not recommended <sup>(9)</sup>	suitable	–
	CWQCCN..L <sup>(11)</sup> , PMFP <sup>(10)</sup> , WQCCN32L <sup>(11)</sup>	not suitable	not suitable	–

## Notes

- For more detailed information on the BGA packages refer to the “(LF)BGA Application Note” (AN01026); order a copy from your Philips Semiconductors sales office.
- All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the “Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods”.
- For SDIP packages, the longitudinal axis must be parallel to the transport direction of the printed-circuit board.
- Hot bar soldering or manual soldering is suitable for PMFP packages.
- These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding  $217\text{ °C} \pm 10\text{ °C}$  measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- If wave soldering is considered, then the package must be placed at a  $45^\circ$  angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- Hot bar or manual soldering is suitable for PMFP packages.
- Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.

## 15 DATA SHEET STATUS

LEVEL	DATA SHEET STATUS <sup>(1)</sup>	PRODUCT STATUS <sup>(2)(3)</sup>	DEFINITION
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

## Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.
3. For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

## 16 DEFINITIONS

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

**Limiting values definition** — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

## 17 DISCLAIMERS

**Life support applications** — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

**Right to make changes** — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

## Digital video encoder

SAA7102; SAA7103

**18 PURCHASE OF PHILIPS I<sup>2</sup>C COMPONENTS**

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.

# *Philips Semiconductors – a worldwide company*
