

# 54122/DM74122 Retriggerable Resettable Multivibrator

## General Description

The '122 features positive and negative DC level triggering inputs, complementary outputs, an optional 10 kΩ internal timing resistor and an overriding Direct Clear ( $\overline{C}_D$ ) input. When the circuit is in the quasi-stable (delay) state, another trigger applied to the inputs (per Truth Table) will cause the delay period to start again, without disturbing the outputs. This process can be repeated indefinitely and thus the output pulse period (Q HIGH,  $\overline{Q}$  LOW) can be made as long as desired. Alternatively, a delay period can be terminated

by a LOW signal applied to  $\overline{C}_D$ , which also prevents triggering. An internal connection from  $\overline{C}_D$  to the input gate makes it possible to trigger the circuit by a positive-going signal on  $\overline{C}_D$ , as shown in the Truth Table. For timing capacitor values greater than 1000 pF, the output pulse width is defined as follows:

$$t_w = 0.32 R_X C_X (1.0 + 0.7/R_X)$$

Where  $t_w$  is in ns,  $R_X$  is in kΩ and  $C_X$  is in pF.
